Topic to Present:

Select a class:
☐ Water Essentials/Global Water Concerns (GEG 1910) The course presents students with a comprehensive foundation in the water cycle, human use of water, water and the environment, the politics of water, and the critical issues surrounding water as a resource. The course will educate Colorado water users on the sources and uses of their water, its importance as a resource, the critical issues of water conservation and scarcity, and the legal, political, economic and physical infrastructure that controls water in the American West.
☐ Water Resources (ENV 3400) This course presents an analysis of water as a major resource. It includes the study of the hydrologic cycle, competing water uses, current water problems, and approaches to water management. The relationship of water to land use is examined in terms of dams, watersheds, water laws, pollution, and flood control.
☐ Colorado Water Law & Water Rights Administration (MGT/ENV 3250) This course provides students with an in-depth study of the unique nature of Colorado water law and Colorado water rights administration. The course will survey the key issues surrounding the legal framework governing the allocation of water resources, administrative processes affecting water distribution, and policy considerations that influence decisions about the use and management of water resources in the state of Colorado. An overview of Colorado climate, geology and hydrology, as well as a review of Colorado’s early water use and development will provide the context for the study of the legal system with which the state and its citizens allocate water.
☐ Water Law (ENV 4410) This course surveys U.S. water law and administration. Topics include (1) why we need laws regulating water use, (2) how ancient water laws influenced U.S. water law, (3) variations of surface and groundwater law, including prior appropriation, riparian, and hybrid, (4) international and interstate agreements, and (5) a special focus on water administration in the West.
☐ Covering the Environment (JRN 3570) Students in this course analyze corporate and public environmental issues in the West and how they are covered. Students employ ethical paradigms in comparing and contrasting environmental issues and their coverage. Ultimately students compose journalism projects that detail the impact of environmental policy on end users.
Colorado Water and the American West (HIS 3426) This course invites students to study the rich history of water in Colorado and the American West. From the beginning, humans in the American West have had to contend with arid environments. This course begins with a look at how the Ancestral Pueblo, and other Native communities used water. Next the course treats Hispanic water management practices in the West, before finally focusing on the American approach to water management in the region. With Colorado as a focal point, the class will explore the fascinating tangle of federal, state, and local interests that led to one of the greatest hydraulic societies in the history of the world.

American National Government (PSC 1010) This course introduces the basic principles, institutions, actors, and processes of American National Government. It allows the student to recognize the U.S. Constitution's design and its lasting influence. It also presents some of the changing social, economic, and political variables that create powerfully new conceptions of the structure, purpose, and flow of American politics.

American History to 1865 (HIS 1210) This is an introductory course in the history of the American peoples and the development of the United States through the Civil War. It will present an interpretation of how North American cultures--indigenous, European, and African--converged and influenced one another. It will also focus on how the British colonies created a new social order, along with political institutions, that continually evolved until 1865.
